Title ?

## Introduction

In this report I will be writing about the life cycle of a plant, parts of a plant and how do plants survive. There are different groups of plant. One group is called flowering plant and the others are called non-flowering plant. There are 250,000 flowering plant in the world.

## Life cycle of a plant?

First you put a seed into the <sup>ground</sup> grow end. Then water it for a few days. It uses sunlight. As a result of, those things the seed turns into roots, then grows into a plant.

## Parts of a plant

Roots get water from the <sup>soil</sup> soil and give it to the stem so the plant is healthy. The stem keep the plant up so the plant keep getting sunlight from the sun. Leaves are food factory of a plant.

## How do plants survive?

To survive they need light from the sun because sun makes it healthy, as well.

Water from the <sup>soil</sup> soil so it is healthy. They use <sup>carbon</sup> dioxide from air.

## Conclusion

I think plant are important because they make medicine.
