

## The Newly Discovered Planet Aquamarine

Did you ever wonder if there was a ninth planet?

Well guess what! On the 15<sup>th</sup> of February, scientists found a new planet and they called it Aquamarine. They found out that Aquamarine had lots of life on it and that there were some unusual creatures living on it. They found out that on the newly opened planet, which is probably the coldest planet in the solar system, there was a frozen man. The scientists now knew that this planet had been visited by a person. So they thought it might be dangerous. But don't worry - there is special armoured gear in case you are in danger. Different to Earth, Aquamarine has a burnt out sun that no longer produces light. The scientists called it the dark sun. Unlike Earth, the newly discovered planet has two satellites.

In contrast to Earth, the open planet has half human, half robotic life, but they won't do anything to you because you are going to be in a different area where there is not even a single one in sight. The surface of the planet is smooth but slippery. There isn't much gravity so you will be floating. One day on this planet is like two days on Earth.
